

LEVEL 1 • MASTERCLASS • 4 HOURS • ₱1,999

The complete framework.

Asset selection, buying zones, prudent borrowing mechanics, and the risk rules that protect you.

Buy Borrow Thrive • The Confident Investor's Blueprint • Education only • No fund management

Five things before we start

1

Questions at the end of each module

2

Mic off, camera on

3

Pressing question — chatbox

4

100% participation. Learning needs positive energy.

5

Calculators ready — we love Math because we make Money

BEFORE WE BEGIN

Three things are true and we will not soften them.

The platform can sell your Bitcoin without asking. Both rates float and can invert. Your money sits somewhere we do not control.

TONIGHT

Four modules

1

Buy Borrow Die

The principle, and the price
that ends you.

2

Yen Carry Trade

Borrow cheap, deploy dearer
— and how it unwound.

3

Entry Levels

Where you buy, and how you
accumulate.

4

Capital Preservation

The module that keeps you in
the game long enough for the
first three to matter.

Just like Cashflow — you learn the board before you play it. Type “Ok” in the chat.

1

MODULE ONE

Buy Borrow Die

Land, a bank, a foreclosure — and the same shape done digitally.

2021 → 2026

The hectare in BGC

₱1,000,000

what you paid in 2021

₱2,000,000

what it is worth in 2026

You want money out. You do not want to sell. What are your options?

What borrowing against it actually takes

1

Appraised

You pay the appraisal fee.

2

Title

Due diligence — is it yours, are your taxes current?

3

Approved

And you might not be.

4

80% loan-to-value

Calculators. 80% of ₱2M = ₱1.6M.

5

Less the deductions

Insurance, amortisation, credit loan protection. May mga bawas pa yan.

AND IF YOU CANNOT PAY

Foreclosed.

Months. Missed payments, notices, letters, chances to fix it. Hold that timeline — it matters in ten minutes.

Physical and digital real estate

Land

Physical real estate

- Millions of pesos to start
- Months of process to borrow
- Foreclosure takes months and sends letters
- Fees and insurance reduce your loan

Bitcoin

Digital real estate

- About ₱6,000 to start
- Minutes to borrow
- Liquidation takes SECONDS and nobody calls
- You receive the whole amount — but the rate is not “very low”

THE NUMBERS

You have \$100 and Bitcoin is at \$100,000

\$100

your capital

0.001

BTC you can buy

78%

the platform will lend you this much

Round numbers so the math is clean. But — should you borrow 78%?

Borrow 78%, price falls 10%

Method	Calculation	New LTV
Quick field check	$78 + 10$	88%
What the app shows	$78 \div 0.90$	86.7%
Margin call at	85%	crossed
Liquidation at	91%	next stop

Write down both. The quick version always reads higher, so it errs safe — but the app will show the lower number and I do not want you thinking the app is lying. A 10% Bitcoin drop is a Tuesday.

DRILL ONE

Entry \$90,000 · LTV 60% · price drops to \$50,000

Step	Working	Result
The drop	$90,000 - 50,000 = 40,000$	—
As a percentage	$40,000 \div 90,000 \times 100$	44%
New LTV	$60 \div 0.556$	108%
108% vs 91%	past liquidation	LIQUIDATED

Does a 44% drop happen in Bitcoin? Yes. 2018, 2021, 2022. Not a black swan — a cycle.

DRILL TWO

Same entry · LTV 50% · price drops to \$60,000

Step	Working	Result
The drop	$30,000 \div 90,000 \times 100$	33.3%
New LTV	$50 \div 0.667$	75%
75% vs 91%	under liquidation	NOT LIQUIDATED

Give yourselves a hand.

THE CORRECTION

50% is not the safe number

Opening LTV	Margin call at	Liquidated at	Survives 2021 –53%?	Survives 2022 –77%?
78%	–8.2%	–14.3%	No	No
50%	–41.2%	–45.1%	No	No
40%	–52.9%	–56.0%	Barely	No
30% — BBT ceiling	–64.7%	–67.0%	Yes	No
20%	–76.5%	–78.0%	Yes	Barely

BBT: position LTV $\leq$ 30% • programme LTV $\leq$ 20% • reserve 1:1. Two different numbers — you need to be able to say both of yours.

QUESTIONS, THEN BREAK

Ten minutes.

Three questions before we go. Bound it out loud, take three, then break.

2

MODULE TWO

The Yen Carry Trade

Borrow cheap, deploy dearer — and the half nobody teaches.

The trade the institutions ran

1

Borrow ¥ at ~0%

Bank of Japan zero interest rate policy.

2

Convert to USD

¥1B at ¥159/\$ ≈ \$6,289,308.

3

Buy T-bills at 4%

Earning \$251,572 a year.

4

The carry = 4% - 0%

The gap between what you earn and what you pay.

Calculators. And what interest do they owe Japan? Zero.

THE HALF NOBODY TEACHES

The loan is repaid in yen.

If the yen strengthens, your dollars buy fewer yen. The 4% is gone — and past a point, your capital with it. In August 2024 the Bank of Japan raised rates, the yen surged, and everyone holding this trade unwound at once. Equities fell. Crypto fell. Years of carry given back in a week.

YOUR VERSION

Bitcoin falls.

Same shape. Same failure mode. Same fix — keep the borrow small enough that the unwind cannot reach you. That is the 30%. That is the reserve. That is why we are strict about a number that looks boring.

YOU CANNOT PLAY UNLESS YOU HAVE

Stablecoins

USDT

tokenised US dollar

=

same value

USDC

tokenised US dollar

\$1 = 1 USDT = 1 USDC. Different companies issue them — that is the only difference. Sino dito naglaro na sa Timezone? You convert pesos to credits before you can play.

Three things before you get excited

1

The headline earn rate is tiered

It applies to a first tranche only. Above the cap you drop to a much lower rate. Your blended rate is what matters.

2

Both rates float independently

The gap narrows. Some months it inverts and you pay more than you earn.

3

The money sits on a platform

That is its own risk and no strategy here protects you from it.

One step at a time

1

Buy

The asset, at a level.

2

Borrow

Against it, never selling.

3

Convert

Into the earning stablecoin.

4

Earn

The spread — small, and not the point.

You end up holding two things: your Bitcoin, and capital you did not have before.

3

MODULE THREE

Entry Levels

Where you buy, and how you accumulate without adding money.

The Fibonacci buying zones

0.618

first level — shallowest, most often reached

0.50

second level

0.382

third level — deepest, best price

In TCIB these were about entering well. Here they do a second job: instead of selling at the next level up, you borrow against it.

\$100 in, price drops

Step	Price	Action	BTC held
Buy	\$100,000	\$100 in	0.00100
Borrow 30%	\$100,000	you hold \$30 USDT	0.00100
Price falls	\$85,000	What do you do?	0.00100
Buy	\$85,000	deploy the \$30	0.00135

35% more Bitcoin than you started with — and you never added new money.

\$100 in, price rises first

Step	Price	Action	BTC held
Buy	\$100,000	\$100 in	0.00100
Price rises	\$115,000	position worth \$115	0.00100
Borrow 30%	\$115,000	instead of selling — \$34.50	0.00100
Buy the dip	\$85,000	deploy the \$34.50	0.00141

More Bitcoin than scenario one — and you still hold the original position.

THE CATCH

For every \$100 you deploy, hold \$100 back.

Untouched. Not in the position, not in Earn where you would be tempted. That reserve is what lets you buy a 60% drawdown instead of being liquidated by it. And in a margin call the top-up comes from reserve — never from borrowing more. Buying with borrowed money raises your loan and your collateral together; it rescues nothing.

NO SIGNAL

What if you bought without a signal?

1

Your buying price becomes your 0.618

Plot the Fibonacci as normal, then move it so 0.618 sits on your entry.

2

But understand what you just did

Walang basehan yung Fibonacci mo if you moved it to wherever you happened to buy.

3

This is not encouraged

It only shows your next levels given you already bought. It does not make a bad entry good.

4

MODULE FOUR

Capital Preservation

The module that makes the other three worth anything.

THE SENTENCE

A drop is not a loss until you are forced to sell.

Module 1 ended on a word: foreclosed. This is the general version. Everything in the next forty minutes is one question — how do we remove the force?

Open at 30% LTV — what each price fall means

Price falls	Your LTV	What you do
-25%	40%	Log it. Nothing else.
-40%	50%	Confirm reserve, calculate the top-up. Do not execute.
-50%	60%	ACT. Top up from reserve, or close the loan.
-64.7%	85%	Platform margin call — you never arrive here
-67.0%	91%	Liquidation — you never arrive here

Seventeen percentage points between “act” and “liquidated”, with a written instruction sitting inside it. That gap is what you are buying with the discipline.

Four of these five hit Alarm 3

Alarm 3 is not an emergency. It is a normal event — about once a year, for seven years. Someone who thinks it is a catastrophe will panic. Someone who expects it will act.

You bought the 2021 peak at our 30% ceiling

Price	Event	What you do
\$69,000	Open at 30% LTV, reserve funded 1:1	—
\$51,750	–25% • Alarm 1	Log it
\$41,400	–40% • Alarm 2	Calculate the top-up
\$34,500	–50% • ALARM 3	Close the loan from reserve. Keep every satoshi.
\$22,747	would have been liquidation	Loan already closed. Nothing to sell.
\$15,500	the 2022 bottom	Still holding 100% of it

Liquidation price = $69,000 \times 0.30 \div 0.91 = \$22,747$. The 2022 low was ~\$15,500 — so left alone, this position IS liquidated. 30% by itself does not save you.

THE HONEST HALF

You still took the drawdown.

At the bottom of 2022 that Bitcoin was worth about 23 centavos on the peso. Our rules did not stop that. Nothing stops that. What they did was make sure you still owned all of it — so when it turned, it turned in your hands. We preserve the asset. That is what lets you choose your own timing.

Resolving the contradiction you just watched

Module 2 said

- Borrow USDT
- Convert to USDC
- Park it in Earn
- Collect the spread

Module 3 said

- Borrow USDT
- Hold it
- Wait for your level
- Buy the dip

WHAT YOU CAN NOW DO

Most people who own Bitcoin cannot do what you just did.

You computed a liquidation price from a peak you did not choose, and you found the one instruction that saved a position through a 77% drawdown.

WHAT YOU STILL CANNOT DO

It was all on paper.

You have never funded a wallet, moved money between two platforms, posted collateral, or watched an LTV slider move with your own money behind it. And there is a night coming — down 40%, phone going off, 3am, acting in order while tired. Tonight you learned that night exists. You have not rehearsed it. Reading the fire exit is not the same as walking it in the dark.

Level 2/3 — one curriculum, two ways to take it

Deep Dive · ₱15,000

3 days, online, pods of 8

- Chart structure and weekly levels
- The platform, end to end
- Your first live position
- LTV discipline and the scored drill
- The accumulation system

Immersion · ₱75,000

3–4 days, face to face, small class

- Everything in the Deep Dive
- In a room, with faculty
- Your complete personal playbook
- The transfer question
- One-to-one playbook review

Do not take Level 2 or 3 if

1

You are not going to fund the reserve

You saw tonight what did the saving. Half the rule set is worse than none — it feels like protection and is not.

2

You would use money you need inside five years

Nothing we teach makes short money safe.

3

Tonight made you excited rather than careful

Sit with it a week. Excitement is what puts people at 78% LTV.

ONE STEP

Registration is in the chat.

Next Deep Dive {{level_2_date}} • next Immersion {{level_3_date}} • {{seat_cap}} seats, because pods run one coach to eight and we do not stretch that. Unsure which — or unsure at all? Message {{ops_lead}} and say so. You will get a real answer, including “not yet”.
