Modules 1–3

Chart structure and levels • the platform • your first live position.

Buy Borrow Thrive • Level 2 ₱15,000 online • Level 3 ₱75,000 face to face

1

MODULE ONE • 180 MIN • BOTH MODES

Chart Structure & Levels

Everything downstream is a level. A participant who cannot set one is guessing with a rulebook.

Your timeframe decides who you become

1

5-minute chart

You will find a reason to act several times an hour.

2

Daily chart

A few times a week.

3

Weekly chart

A few times a year. This is ours.

AND NO INDICATORS

**Structure only. Where price has turned before,
and where it has not.**

Every indicator is derived from price. If you can read structure, the indicator adds a second opinion from the same witness — and a reason to hesitate when you should act.

WHAT A LEVEL IS

**Levels are for deciding in advance,
not knowing in advance.**

A level is a price where a decision has been made before — where buying overwhelmed selling, or the reverse. It is not a prediction. It does not tell you what will happen; it tells you where you will act if it does.

Three rules that keep you honest

1

Use the most recent complete major move

Not the prettiest one.

2

If you have to squint to see the swing, it is not one

A clear turn, not a wobble.

3

Wicks or bodies — pick one and never change

We use wicks, because the wick is where trades actually happened.

Three levels, ordered by how often you will see them

0.618

first — shallowest, most often reached,
commits least

0.50

second — the midpoint

0.382

third — deepest, rarest, best price when it
comes

First, second, third — by likelihood, not depth. That is the order they arrive in, and the order you deploy in.

AND SOMETHING NO ONE ELSE TELLS YOU

Your levels are not my levels.

Plot the same chart in this room and we will be a few percent apart. Different swings, wicks versus bodies. That is fine — we are not finding the one true level, we are building a band you decided on in advance. The precision that matters is not in the number. It is in having written it down before the candle got there.

A level does three jobs

1

Where you buy

The obvious one — and the only one most courses teach.

2

Where your ladder deploys

Module 6. You do not spend everything at one level.

3

Where your alarms sit

Module 4. Your LTV alarms convert to prices, and those prices live on this chart.

WHEN PRICE IS BETWEEN LEVELS

Do nothing.

That is the answer, and it is the hardest one in the programme. Most of the time price is between levels, and most of the time the correct action is none. If you need to be doing something to feel like an investor, this strategy will be uncomfortable — and you should find that out now rather than in month four.

BELOW EVERY LEVEL

When it goes below 0.382

1

Your ladder is spent

That is the ladder working as designed, not failing.

2

Your reserve is not for this

Reserve defends the position you have. Module 6 is strict about it — this is how a disciplined person blows up.

3

Only new money from income buys down here

Not reserve. Not borrowed capital.

When to move your levels

1

A new weekly swing completes

That is the only trigger. In practice, a handful of times a year.

2

Not when price goes somewhere you dislike

3

Not when someone posts a chart

4

Not when you are bored

THE DISHONEST MOVE

Buying with no signal, then sliding 0.618 onto your entry.

Walang basehan yun. You have drawn a level around a decision you already made and given it the appearance of a plan. It has one legitimate use: showing your next levels given you already bought. If you find yourself doing it often, the problem is not your chart.

Your Level Card

1

Swing high and swing low

The two points everything else is derived from.

2

Your three levels

$0.618 \cdot 0.50 \cdot 0.382$

3

The date you plotted them

Undated levels get trusted long after they should have been redrawn.

4

Coach signature

You carry this into Module 4 for your alarms and Module 6 for your ladder.

2

MODULE TWO • 90 MIN • BOTH MODES

The Platform

Funding, stablecoins, and the transfer where people lose money to carelessness rather than markets.

TONIGHT THE MONEY IS REAL

Pre-flight: verified, funded, installed.

Coaches confirm pod by pod, out loud. Anyone who fails the gate leaves for the next cohort — warmly, and without staying “just to watch”. They will pull a coach away from their pod within twenty minutes.

The whole level on one screen

Then: Collateralise · Borrow · Manage risk · Apply the principle · Execute. Return to this slide at every module transition — it is how eight pods stay together.

THE CHECKLIST THAT GOES ON YOUR PHONE

**ASSET → ADDRESS → NETWORK →
AMOUNT → FEE → CONFIRM**

Six words. Say them with me. The one that ends people is NETWORK — if the asset is right and the address is right but the network is wrong, the money goes somewhere neither Coins.ph nor Binance can retrieve it from. There is no support ticket for that.

SAY IT PLAINLY

Wrong network = gone.

Not recoverable by Coins.ph. Not recoverable by Binance. Not recoverable by support. The address and the network must match — both, every time, including the hundredth time when you are confident and not looking.

Not just another crypto you hold

1

The unit you borrow in

2

The unit you earn in

3

The unit your LTV is measured in

It is the ruler you measure everything else with. If it moved, none of the arithmetic from Level 1 would hold.

Four tabs. Only four.

1

Overview

Everything you hold and what it is worth.

2

Earn

Where lending and borrowing live. The engine room.

3

Spot

Your actual crypto holdings.

4

Funding

Your funding balance and movements in and out.

3

MODULE THREE • 90 MIN • BOTH MODES

First Execution

Asset → collateral → borrow → adjust LTV → check liquidation price.

POSTING COLLATERAL

Pledged, not sold.

Nothing about your Bitcoin changed — you still own the same amount. What changed is that the platform now has a claim on it. Exactly like a title deposited with a bank, except it took four seconds instead of six weeks.

THE PLATFORM WILL OFFER YOU ITS MAXIMUM

That is not advice.

The platform earns on the loan. Its interests and yours are not the same, and there is no rule that says the number it offers is a number you should take. Level 1, drill one: 78% LTV, a 10% drop, margin call. This is the screen where that decision gets made.

SET THE SLIDER TO 30%

Not the platform's max. Not 50. Thirty.

30%

survives a 67% drawdown

50%

survives 45%

78%

survives 14%

Bitcoin has fallen more than 45% three times in the last eight years. Thirty is not caution — it is the number that survives the actual history of this asset.

THE FORMULA

Liquidation price = entry × (LTV ÷ 0.91)

Your LTV	Multiplier	If you entered at \$100,000	Distance from entry
30%	× 0.33	\$32,967	-67%
50%	× 0.55	\$54,945	-45%
78%	× 0.857	\$85,714	-14%, a bad week away

Same asset. Same money. One slider.

GATE

Write it on paper. Not a screenshot.

“If Bitcoin reaches _____, I have already lost the position.” In your own handwriting. Coaches — every person, every pod. Nobody moves to the execution phases without it.

Three phases — you do it, coaches watch

1

Phase A • Coins.ph

Fund → buy stablecoin → prepare transfer.
The six-word checklist read aloud before
anyone sends.

2

Phase B • Binance

Receive → verify asset → trade. Do not trade
until you have SEEN the arrival.

3

Phase C • The strategy

Asset → collateral → borrow → adjust LTV to
≤30% → check liquidation price.

The lead narrates phase transitions only. Coaches troubleshoot inside pods — the lead never stops for one person's app.

Your Position Card

1

Entry price and amount deployed

2

Borrowed, and your position LTV

Must be $\leq 30\%$.

3

Your liquidation price

Written by hand.

4

Your reserve amount

5

Said out loud to your coach

“My LTV is _____. I am liquidated at _____. My reserve is _____.”

What you may and may not do

Do

- Check your LTV once a day — not ten times
- Put your borrowed stablecoin into Earn. Carry only.
- Message your coach if LTV moves toward 40%

Do not

- Raise your LTV. Not for any reason, not for any dip.
- Buy a dip with borrowed capital yet — that needs a written plan you do not have
- Add a second asset
- Improvise at midnight
